

1, Explain uses of ping command in network ?

It is used to check the network ~~of the~~ reachability of the connected computers/devices

Also used to check the time taken for the replay to know if there is any delay

2, Explain netbios protocol ?

It is the protocol used to check network reachability of the devices using its name instead of IP address

3, Explain SMB protocol ?

Server Message Block protocol used to share files, folders and printers between the devices that are ~~com~~ in the Network

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

When 50.0.0.10 pings 50.0.0.20 it also needs MAC address

→ ARP protocols checks if it has destination ~~IP~~ MAC ~~in~~ if its missing. It does a broadcast as a ARP request with 50.0.0.10 and MAC address with Destination IP to all the devices

→ 50.0.0.20 gets this ARP request and reply's back with its MAC address

→ ~~the~~ To send a ~~packet~~ Echo data it need both S.IP, D.IP & SM, DM to send

→ After getting all info it sends Echo and gets Reply
